

Create a Table with Appropriate Data Types

```
MySQL 8.0 Command Line Cli x + v
mysql> CREATE TABLE Students (
  -> studentId INT PRIMARY KEY,
  -> firstName VARCHAR(50),
  -> lastName VARCHAR(50),
  -> age INT,
  -> email VARCHAR(100)
  -> );
Query OK, 0 rows affected (0.03 sec)
```

Insert Sample Data

```
mysql> describe Students
-> ;
+-----+-----+-----+-----+-----+-----+
| Field      | Type          | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| studentId  | int           | NO   | PRI | NULL    |       |
| firstName  | varchar(50)   | YES  |     | NULL    |       |
| lastName   | varchar(50)   | YES  |     | NULL    |       |
| age        | int           | YES  |     | NULL    |       |
| email      | varchar(100)  | YES  |     | NULL    |       |
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.01 sec)

mysql> INSERT INTO Students (studentId, firstName, lastName, age, email) VALUES
-> (1, 'John', 'Doe', 20, 'john.doe@example.com'),
-> (2, 'Jane', 'Smith', 22, 'jane.smith@example.com'),
-> (3, 'Juan', 'Angeles', 23, 'juan.pavonio@gmail.com'),
-> (4, 'Carmen', 'Santos', 30, 'carmen.angelitos@gmail.com'),
-> (5, 'Rodolfo', 'Angeles', 31, 'rodolfo@gmail.com');
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

Understanding Database Basics

A database is essentially a well-organized collection of information, designed for efficient storage, retrieval, and management. It stores data in structured formats, often using tables with rows representing records and columns representing attributes. This systematic approach allows for easy searching, sorting, and filtering of information. Databases are indispensable for managing vast amounts of data in various sectors, such as schools maintaining student records and grades, banks tracking customer accounts and transactions, and e-commerce platforms managing product catalogs and order histories. Their ability to handle and organize information effectively makes them a cornerstone of modern data management.

SELECT

```
MySQL 8.0 Command Line Cli x + v
mysql> SELECT * FROM Students;
+-----+-----+-----+-----+-----+
| studentId | firstName | lastName | age | email |
+-----+-----+-----+-----+-----+
| 1 | John | Doe | 20 | john.doe@example.com |
| 2 | Jane | Smith | 22 | jane.smith@example.com |
| 3 | Juan | Angeles | 23 | juan.pavonio@gmail.com |
| 4 | Carmen | Santos | 30 | carmen.angelitos@gmail.com |
| 5 | Rodolfo | Angeles | 31 | rodolfo@gmail.com |
+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)

mysql> |
```

UPDATE

```
mysql> UPDATE Students SET age = 21 WHERE studentId = 1;
Query OK, 1 row affected (0.01 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql> SELECT * FROM Students;
+-----+-----+-----+-----+-----+
| studentId | firstName | lastName | age | email |
+-----+-----+-----+-----+-----+
| 1 | John | Doe | 21 | john.doe@example.com |
| 2 | Jane | Smith | 22 | jane.smith@example.com |
| 3 | Juan | Angeles | 23 | juan.pavonio@gmail.com |
| 4 | Carmen | Santos | 30 | carmen.angelitos@gmail.com |
| 5 | Rodolfo | Angeles | 31 | rodolfo@gmail.com |
+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)

mysql> |
```

Question 1

The selection of data types for the columns in the Students table was driven by the nature of the information each column is intended to hold and the need for efficient storage and data integrity.

- studentId INT PRIMARY KEY: INT (integer) is an ideal choice for a unique identifier as student IDs are typically whole numbers. PRIMARY KEY ensures that each student has a unique ID and helps in quickly referencing specific student records.
- firstName VARCHAR(50) and lastName VARCHAR(50): VARCHAR(50) is used for names because they are strings of characters and can vary in length. Specifying a maximum length of 50 helps in allocating appropriate storage space without over-allocating for shorter names, thus optimizing storage.

- age INT: Similar to studentId, age is a whole number, making INT the most suitable and efficient data type.
- email VARCHAR(100): Email addresses are strings of characters and can have varying lengths. VARCHAR(100) allows for storing email addresses up to 100 characters long, accommodating most standard email formats while conserving space.

Question 2:

Databases offer several significant advantages over simple file storage systems like spreadsheets:

- **Data Organization and Structure:** Databases enforce a structured format, making data easier to manage, query, and analyze compared to the often free-form nature of spreadsheets.
- **Data Integrity and Consistency:** Databases often support constraints (like PRIMARY KEY) and relationships between tables, which help maintain data accuracy and consistency, reducing redundancy and errors.
- **Scalability:** Databases are designed to handle large volumes of data and can efficiently manage growing datasets, unlike spreadsheets that can become slow and cumbersome with large amounts of information.
- **Concurrency and Multi-user Access:** Databases allow multiple users to access and modify data simultaneously in a controlled manner, which is often difficult and prone to errors in shared spreadsheets.
- **Querying and Reporting:** Databases have powerful query languages (like SQL) that enable complex data retrieval, manipulation, and the generation of insightful reports, functionalities that are limited in spreadsheets.
- **Security and Access Control:** Databases offer robust security features, allowing administrators to control who can access and modify specific data, providing better protection than simple file permissions.
- **Data Relationships:** Relational databases can model complex relationships between different sets of data, which is crucial for managing interconnected information effectively – something spreadsheets struggle with.
